

Project Proposal Aethea

Title: Aethea -Clarity in health (Arabic-first)

Location / Focus: Egypt (local lab formats, Arabic UX, WhatsApp integration)

Name	ID
Kirolos Mourice William	192100132
Mohamed SaadEldin	192100137
Andrew Wageh	192100099
Mostafa Abdallah	192100058
Omar Mahmoud Atwa	192100141
Sherif Diaa	192100037

Under Supervision of
Dr/Islam Mohammed

1. Introduction

We propose the development of a smart healthcare platform that leverages Artificial Intelligence (AI) to assist patients, doctors, and medical institutions. The system combines medical scan analysis, personalized medicine guidance, nutrition planning, reservation booking, and secure doctor–patient interaction, all while ensuring strict data privacy and security.

2. Objectives

1. Provide patients with simple and accurate understanding of their medical scans and blood tests.
2. Help patients identify safe and suitable medicines based on their health conditions.
3. Support doctors with AI-assisted feedback while allowing them to review and correct outputs.
4. Improve healthcare accessibility with location-based services and online consultations.
5. Ensure privacy, security, and compliance with medical data handling standards.

3. Deliverables

1. Mobile application for patients and doctors (multi-language support: Arabic & English).
2. AI-powered medical scan and blood test analysis system.
3. Medicine knowledge base (leaflets, side effects, contraindications, flagged medicines for special conditions).
4. Reservation system with doctor accounts, scheduling, and location-based search (Google Maps).
5. Nutrition and post-surgery recovery guidance (AI-supported).

6. Online doctor consultation and secure chat system.
7. Cybersecurity and privacy framework (encryption, role-based access, audit trails, consent templates).
8. Pilot report with accuracy metrics, patient comprehension results, and clinician feedback.

4. Features

1. **Medical Scan Upload & AI Analysis** (PDFs, images, X-rays, blood tests).
2. **Patient–Name Verification** to prevent storing feedback under the wrong account.
3. **Medicine Guidance**: shows suitable medicines and warns patients about unsafe options (e.g., diabetic patients avoiding specific cold medicines).
4. **Nutrition & Lifestyle Guidance**: personalized diet and calorie plans based on medical results.
5. **Reservation & Doctor Portal**: location-based doctor/clinic/pharmacy finder + dedicated doctor dashboard.
6. **Post-Surgery Assistant**: videos, exercises, and AI tips for recovery.
7. **Doctor-Patient Communication**: secure chat and video consultations.
8. **Emergency Alerts**: automatic warnings for critical health indicators (e.g., high risk of stroke).
9. **Accessibility Options**: large fonts, voice guidance for older patients.
10. **Legal & Consent Layer**: disclaimer that AI is not a replacement for doctors.

5. Challenges

1. Ensuring AI accuracy and precision in medical interpretation.
2. Handling sensitive medical data securely and in compliance with regulations.
3. Building patient trust in AI-powered healthcare tools.
4. Integration with multiple healthcare providers and pharmacies.
5. Maintaining multi-language and culturally adapted interfaces.

6. Unique Value

1. **Medicine Suitability Flagging:** A unique feature where the system cross-checks patient conditions (e.g., diabetes, hypertension) with medicines and warns about risks.
2. **Doctor Feedback Loop:** Doctors can validate or correct AI outputs, continuously improving system accuracy.
3. **End-to-End Ecosystem:** Combines scans, medicine guidance, nutrition, reservations, and recovery in one platform.
4. **Strong Cybersecurity Layer:** Full encryption, audit trails, and secure consent handling.
5. **Regional Relevance:** Designed specifically for the Arab region with Arabic/English support.
